

On the forefront of astronomical research

ESO

(05 November 2014 part of Lecture 5 & 6 & 7)

Outline

Brief history of ESO

ESO observatories overview

Detectors and instruments

Behind the scenes (how to get time?)

approx. 700 employees (various national.)

4 observatories (1, ALMA, jointly operated)

HQ in Garching, Offices Santiago

Director General + 5 directorates

In more detail....

ES

Brief history of ESO How did it all start?

21 June 1953 Leiden

Why conferences are important!

http://www.eso.org/public/images/wbaade-cschalen/ http://www.eso.org/public/images/vkourganoff-jhoort-hspencer/

ESO is born

- In October 5, 1962, after years of meetings and struggles, the ESO Convention, between five of the first six countries was finally signed (Great Britain went its own way). The required ratification, however, was only completed in January 17, 1964
- Belgium, France, Germany, Great Britain, the Netherlands and Sweden (later GB left the negotiations)

 Southern hemisphere selected (SA preferred that time)

Africa?

- http://www.eso.org/public/images/south-africa-1961-05/
- http://www.eso.org/public/images/south-africa-1961-03/

Direction Chile!

Why Chile?

- Site testing near today's La Silla proven better than South Africa in 1960's
- Relatively good accessible, dry environment, easier for logistics, owned by the government
- La Silla selected 26 May, 1964 (Cinchado-Norte mountain)

 October 30, 1964 contract between ESO and Chile signed

La Silla inauguration

- March 25, 1969
- mid sized telescopes

 n., 1.5-m, 1.2
 Schmidt
 50-cm ESO telescope

 later national

 telescopes

Dream comes true!

http://www.eso.org/public/images/lso_inauguration_03-69_2/

La Silla

Paranal approved December 1987

http://www.eso.org/public/images/council87/

VLT inauguration 4 December 1996

http://www.eso.org/public/images/1996-12-vlt-inaugur/

ALMA inauguration 13 March 2013

http://www.eso.org/public/images/ann13027a/

E-ELT start 19 June 2014

http://www.eso.org/public/images/eso1419a

http://www.eso.org/public/images/potw1424a/

Overview of ESO facilities (as of today)

ESO sites today

- Concept of national telescopes
- NTT ESO
- 3.6-m ESO with planet hunter HARPS
- 2.2-m Max Planck Institute FEROS, WFI, GROND

APEX The Atacama Pathfinder Experiment

- 1st light 14 July 2005
- single 12-m dish
- Pathfinder for ALMA

• Science goals are: astrochemistry, cold Universe

Atacama Large Mm/submm Array (JAO) Operated by: ESO, NAOJ, NRAO

- Chajnantor plateau •12-m array of 4 antennas
 4500-5000 m 7-m array of 12 antennas
- 66 antennas
- 0.32 to 3.6 mm
- 12-m array 50 antennas

- baselines 150m-16km
- Star formation, molecular clouds, early Universe

Key science topics

- Extra-solar planets
- Resolved stellar populations in a representative sample of the Universe
- The physics of high redshift galaxies
- Cosmology and fundamental physics Operations start - 2024

Benefits of ESO membership (CZ perspective)

ESO and the Czech Republic

CZ joined ESO in 2007 as member state nr. 13

 Direct access to all ESO facilities for CZ affiliated astronomers

- in case of visitor mode run all expense for trip paid for by ESO

 Influence in decision making for ESO's heading (ESO council, ESO finance committee, ESO scientific technical committee, ESO users committee)

ESO and the Czech Republic

Preference for employment of CZ nationals

Preferred access to ESO studentship/internship

Support for CZ companies in tenders

 Potential for boosting of international collaboration

 Participation of CZ in forefront astronomical research facility

That was 13th anniversary April 1, 2012 (Google)

Let's hope for another 13+ anniversaries

How does ESO work?

Outline

- Detectors at ESO
- Telescopes
- Adaptive optics
- LIVE from Paranal (tech. permitting 12 Nov)
- Paranal instrumentation programme (12 Nov)
- Behind the scenes (12 Nov)

Detectors at ESO

CCDs (you know them already)

- E.g. FORS2 EEV and MIT detectors (blue, red)
- Highly linear till 65000 ADUs
- Large field of view
- Photoelectric effect
- Optical detectors at ESO controlled by FIERA controllers (optical, NIR is IRACE) – box attached to the detector/instrument which commands the detector directly – interface with user

IR detectors (NO CHARGE TRASNFER)

- no charge trasnfer
- but photoelectric effect in charge!
- electronical readout
- typically Id and Hg due to suitable band gaps
- cooling required

HgCdTe 0.48 eV = 2.55 μ m InSb 0.23 eV = 5.4 μ m

IR detectors

Readouts NON-Destructive

- DCS
- Fowler
- DIT vs. NDIT
- Temperature sensitive
- high sky counts
- instrument/telesc. heat
- 3+ micron nodding/chopping = M2/telescope offsets
- Cooling + vacuum for NIR detectors is a must!

Joyce, D., NOAO Gemini data workshop 2010

Where to find them?

- Si CCD 0.3 1 μ m 170 K FORS2, GMOS
- HgCdTe 0.8 2.5 μm 75 80 K HAWKI NIFS, NICI, FLAMINGOS2
- InSb 0.8 5.4μm 30 K CRIRES, NACO NIRI, GNIRS, PHOENIX
- Si:As 5 28 μ m 12 K VISIR, MICHELLE, TReCS

UTs Antu, Kueyen, Melipal, Yepun

Unit Telescopes

- Active optics (deforming M1)
- Guiding
- 3 instruments

M2 tower

ASTRONET - Estonia, September 16, 2014

Telescope adapter

Coude focus UTs

Auxiliary Telescopes

- 1.8-m telescopes (Coude)
- 4 telescopes, support VLTI (interfermoetry)
- Baselines up to 200 m
- movable

Adaptive optics Fighting the atmospheric turbulence

Diffraction limited imaging

Figure 1: Desponse density of wavefront aburrations generated by various sources. The spatial frequency is measured in terms of D, the diameter of the telescope

Figure <: Adaptive Optics with laser guide star

Figure 2: The principle of Active and Adaptive Optics

Source ESO web

Diffraction limited

ESO archive

PARLA (LGS)

- Up to 7 Watts of output and is very stable. In the future 4 lasers together.
- This upgrade of the laser source takes advantage of a new solid-state <u>Raman fibre laser technology</u> currently under development at ESO, together with <u>industrial partners</u>, for the AOF.
- During the commissioning, and for demonstration purposes, several targets were successfully observed using the new laser in conjunction with different VLT instruments. These included the dwarf planet Haumea and its moons, observed with SINFONI, and the nucleus of Centaurus A with NACO. These observations are available from the ESO <u>Science Archive Facility</u>.
- The original PARSEC dye laser saw six years of service, during which it enabled important discoveries, particularly on the Galactic Centre. The upgrade simplifies the laser operation greatly and allows more flexibility in planning observations.
- Picture from ESO image archive

Adaptive optics + LGS

Downing DfA 2009: AO WFS Detectors

Next:

- 12 November: Live from Paranal (if no tech. problems)
- We start at 16:00 but finish 17:15 instead of 17:00!

Have a great week!

Paranal instrumentation programme Lecture 6 (12 November)

ESO image archive

ESO Messenger 154 (Dec 2013), L. Pasquini et al.

ESO picture archive

Requirement	Baseline Specification
Optical Throughput (predicted)	J>20%, H>30%, K>30%
Wavelength coverage	0.8 to 2.5 microns
Spectral Resolution	IZ grating R~3200 YJ grating R~3400 H grating R~4000 K grating R~4200 HK grating R~1800
Number of IFUs	24
Extent of each IFU	2.8 x 2.8 sq. arc seconds
Spatial Sampling	0.2 arc seconds
Patrol field	7.2 arcmin diameter circle
Close packing of IFUs	>=3 within 1 sq arcmin

Closest approach of IFUs >=2 pairs of IFUs separated by 6 arcsec

KMOS

The spectrometers each utilise a single 2kx2k HgCdTe detector and use a reflective collimator with a 6-element achromatic camera.

FORS2

- FORS2 imaging, polarimetry, long slit and multiobject spectroscopy (spec. res. up to 2600)
- MXU spectroscopy with masks
- Long-Slit (LSS) mode
- FORS2 has 9 long-slits with fixed widths of between 0.3" and 2.5".
- Moveable Slitlets (MOS) mode
- FORS2 has a set of 19 pairs of arms that can be moved into the focal plane to form slitlets with user-defined widths.
- 0.25"/pixel (with the Standard Resolution collimator) and 0.125"/pixel (with theHigh Resolution collimator)
- FoV 6.8' x 6.8' and 4.25' x 4.25'

Science highlights – FORS2

 Sterzik, M. et al. 2012, Biosignatures as revealed by spectropolarimetry of Earthshine, <u>2012Natur.483...64S</u>

CRIRES

- Resolving power of up to 10⁵ (0."2 arcsec slit)
- Spectral range from 1 to $5.3 \mu m$.
- Simultaneous spectral coverage is maximized through a mosaic of four Aladdin IIIInSb arrays providing an effective 4096 x 512 focal plane

CRIRES can boost all Additector array in the focal plane.
scientific applications
aiming at fainter objects, higher spatial extended sources), spectral and temporal resolution.

UVES- Ultraviolet and Visual Echelle Spectrograph

2 - KUEXEN (The Moon

BIN DECK TOWN

- Contract

+ES

FLAMES Fibre Large Array Multi Element Spectrograph

UVES

- A cross-dispersed echelle spectrograph designed to operate with high efficiency from the atmospheric cut-off at 300 nmto the long wavelength limit of the CCD detectors (about 1100 nm).
- Two arms UV to B, and V to R
 The two arms can be operated separately, or in parallel via a dichroic beam splitter.
- Resolving power is about 40,000 when a 1-arcsec slit is used. The maximum (two-pixel) resolution is 80,000 or 110,000 in the Blue- and the Red Arm, respectively.

- Three image slicers available
- Iodine cell available

Dekker, H. et al. 2000, SPIE, 4008, 534.

Science highlights - UVES

- Maxted, Pierre F. L. et al. <u>Multi-periodic</u> <u>pulsations of a stripped red-giant star in an</u> <u>eclipsing binary system</u>, <u>2013Natur.498..463M</u> <u>UVES</u> <u>086.D-0194</u>

UVES 075.A-0841, 076.A-0860

FLAMES

- multi-object, intermediate and high resolution spectrograph of the VLT.
- field of view 25 arcmin in diameter.
- feeds two different spectrograph covering the whole visual spectral range:GIRAFFE and UVES.
- GIRAFFE allows the observation of up to 130 targets at the time or to do integral field spectroscopy, with intermediate resolution (either R ~ 25000 or R~ 10000).
- UVES provides the maximum possible resolution (R=47000) but can access only up to 8 objects at the time.

Science highlights - FLAMES

UT3 – Melipal (The Southern Cross)

VMOS - Visible/MultiObject Spectrograph
VSHOOTER
(SPHERE) Spectro Polar interful contractions
Exoplanet Research
VISIR - VIT Imager and Spectrometer for modeling

VIMOS

- VIMOS is a visible (360 to 1000 nm) wide field imager and multi-object spectrograph
- The instrument is made of four identical arms with each a field of view of7' x 8' with a 0.205" pixel size and a gap between each quadrant of~2'. Each arm is equipped with 6 grisms providing a spectral resolution range from ~200-2500 and with one EEV CCD 4k x 2k.
- VIMOS operates in three different modes:Imaging (IMG), Multi-Object Spectroscopy (MOS), and with Integral Field Unit (IFU).
- **IMG:** Imaging is possible in *UBVRIz* filters in a 4 x 7' x 8' field of view.
- **MOS:** Multi-object spectroscopy is carried out using masks (one per quadrant) prepared in Paranal using a laser cutting Mask Manufacturing Unit. Depending on the grism used, the spectral resolution varies from 200 to 2500, and the observable range is from 360 to 1000 nm. The maximum number of slits per mask (quadrant) varies from ~40 at *R*=2500 to ~150-200 at *R*=200, for a field of view of 4 x 7' x 8'.
- **IFU:** VIMOS is also equipped with an integral field unit made of 6400 fibers. The scale on the sky can be changed from 0.67" per fiber to 0.33" per fiber and the integral field unit can cover up 13"x 13" up to 54"x54" on sky depending on spectral resolution and spatial magnification. Spectral resolution and coverage are similar to MOS

Le Fevre, O. et al. 2003, SPIE 4841, 1670.

Science highlights - VIMOS

VISIR (currently upgrade ongoing)

- Built by CEA/DAPNIA/SAP and NFRA/ASTRON
- Provides diffraction-limited imaging at high sensitivity in the two mid infrared (MIR) atmospheric windows: the N band between 8 to 13µm and the Q band between 16.5 and24.5µm, respectively.

VISIR under the Cassegrain Focus of the 8.2-m VLT Melipal Telescope

XSHOOTER

- multi wavelength (300-2500nm) medium resolution spectrograph
- 4 arms with the Acquisition and Guiding camera. It has 3 spectroscopic arms, each with optimized optics, dispersive elements and detectors:

UVB, range 300-559.5 nm VIS, range 559.5-1024 nm NIR, range 1024-2480 nm

- Autoguider of a1.5'x1.5' FoV
- IFU spectroscopy, 1.8"x4" FoV
- Slit spectroscopy

SPHERE (commissioned successfully)

SPHERE continued

- The prime objective of the Spectro-Polarimetric High-contrast Exoplanet Research (SPHERE) instrument for the VLT is the discovery and study of new extra-solar giant planets orbiting nearby stars by direct imaging of their circumstellar environment.
- Wavelength: 0.6 2.3 micron, imaging (11 arces FoV), spectroscopy, coronograph – all using eXtreme adaptive optics – faster than current: 1.2 kHz correction rate, 40 sub-apertures of the WFS

UT4 - Yepun (Venus – the evening star)

SINFONI - Spectrograph for INtegral Field
 Observations in the Near Infrared

HAWKI - High Acuity, Wide field K-band Imaging

MUSE - Multi-Unit Spectroscopic Explorer

HAWK-I

- Cryogenic wide-field imager
- Field of view is 7.5'x7.5
- The pixel scale is of 0.106".
- 4 broad band (Y, J, H & K) and 6 narrow band (Bracket gamma, CH4, H2, 1.061 µm, 1.187 µm & 2.090 µm) filters.

Pirard et al., 2004, SPIE 5492, 510 Casali et al., 2006, SPIE 6269, 29 Kissler-Patig et al., 2008, A&A 491, 941 Siebenmorgen et al., 2011, The Messenger 144, 9

Science Highlights – HAWK-I

• Searching for spiral feaures in external disk galaxies. Data from Grosbol and Dottori 2012.

 Anderson et al. 2010, H-band thermal emission from the 19-h period planet WASP-19b, 2010A&A...513L...3A

SINFONI

- Near-infrared (1.1 -- 2.45 μm)
- IFUpectrograph fed by an adaptive optics module.
- Gratings J, H, K, H+K
- Spectral res. 1500-4000
- 2048 pixels of the Hawaii 2RG (2kx2k) detector
- 3 choices of the slice height.: 250mas, 100mas and 25mas
- Field of views: 8"x8", 3"x3", and 0.8"x0.8"

 32 slitlets are imaged onto 64 pixels of the detector. Thus one obtains 64x32 spectra of the imaged region on the sky.

(Not only SINFONI) AO & LGS

- MACAO, which stands for Multi-Application Curvature Adaptive Optics, is an ESO in-house developed 60 elements curvature adaptive optics system. MACAO-VLTI is the application of this AO principle to be used by the VLT interferometer (VLTI). Four MACAO-VLTI systems have been installed at the each UT Coude' focii feeding the VLTI delay lines with a corrected IR beam from 1000-13000nm with up to 50% Strehl @ 2.2microns.
- eXtrem AO for SPHERE, faster, more strehl, Shack-Hartmann wave front sensor with 40 sub-apertures

Science highlights - SINFONI

- 2012 Gillessen, S. et al. <u>A gas cloud on its way towards</u> <u>the supermassive black hole at the Galactic Centre</u>, <u>2012Natur.481...51G</u> NACO, *SINFONI*, SPIFFI <u>073.B-0085</u>, <u>073.B-0775</u>, <u>074.B-</u> <u>9014</u>, <u>077.B-0552</u>, <u>081.B-0568</u>, <u>081.B-0648</u>, <u>082.B-</u> <u>0952</u>, <u>087.B-0117</u>, <u>087.B-0280</u>, <u>179.B-0261</u>, <u>183.B-</u> <u>0100</u>, <u>60.A-9026</u>, <u>60.A-9235</u>, <u>70.A-0229</u>, <u>71.B-0077</u>
- 2010 Lehnert, M. D. et al. <u>Spectroscopic confirmation</u> of a galaxy at redshift z = 8.6, 2010Natur.467..940L SINFONI 283.A-5058

MUSE

- Integral Field Spectrograph
- It has a modular structure composed of 24 identical IFU modules that together sample, in Wide Field Mode (WFM), a near-contiguous 1 squared arcmin field of view.
- almost the full optical domain with a mean resolution of 3000. Spatially, the instrument is designed to exploit the VLT AO Facility via the GALACSI AO system, sampling the sky with 0.2 arcseconds spatial pixels.
- MUSE is currently offered in Wide Field Mode with natural seeing mode. In the future, once the AOF is commissioned, a Narrow Field Mode (NFM) will be made available, and will cover 7.5x7.5 arcsec² field of view sampled at 0.025"/pixel, always with AO-correction.
- Science Objectives
- Formation of galaxies
- Nearby galaxies
- Stars and resolved stellar populations
- Solar system
- Serendipity

VLTI

Interferometry

• Combining the light from 2-4 telescopes (VLTI)

- AMBER, MIDI, PIONIER (all NIR wavelengths)
- More details in lecture by Dr. Liz Guzman 03
 December especially ALMA
- Reading:

https://www.eso.org/sci/meetings/2010/stars 2010/Presentations/Primerhaniff_garching10-as-used.pdf

PIONIER

• 4 telescopes

SM observing

Maximize **science efficiency** by executing the programmes with highest scientific priority first and under the required observing conditions;

Maximize **operational efficiency** by sharing calibration data between programmes, and by helping infrequent users of complex facilities in optimizing the use of the allocated observing time;

Maximize the **scientific use** of telescope time by having appropriate programmes ready for execution under a broad range of observing conditions;

Maximize the **scientific productivity** of the facility by means of the reuse of the data, made possible by building uniform data sets accessible through an archive.

Who is involved at ESO side?

- The <u>Observing Programmes Office(OPO)</u>,
- The User Support Department (USD),
- The Paranal Science Operations Team or
- the La Silla Science Operations Team,
- The <u>Data Flow Operations (DFO) Department and its Quality</u> <u>Control (QC) Group</u>, and
- The <u>Science Archive Facility (SAF)</u>.

Further I will talk mostly about Paranal operations!

Hints for a successful SM OB

- Check carefully your observing constraints!
 - do you really need 0.6" seeing?
 - do you really need dark time?
 - do you really need photometric conditions?
 - can your program be done as a filler?
- BUT if you need one or more of above conditions do NOT relax the OB constraints
- The time scheduling constraints double checked?
- The coordinates, proper motion value and offsets etc. double checked?

Visitor Mode (VM)

- Used for difficult and challenging runs where real time decision are required
- The visiting astronomer is responsible for preparation and checking of his/her OBs directly at Paranal
- The visitor is supported directly by the Night Astronomer and/or the Telescope Instrument Operator at the telescope control in the Control room
- The losses due to weather are not compensated

How to decide VM or SM?

 Difficult run? Adjustments needed during the run? Special modes are requested?

> THEN Visitor Mode

 Flexible scheduling constraints? Easy run, where target can be identified well or the position is known? And many hours of observing needed?

> THEN Service Mode

The observing process (what happens after phase 2?)

Paranal Operations

- Engineering maintenance of the instruments
- Paranal Science Operations department:
 - **Astronomers** operation of the instruments, SM queues, astronomical decisions during observing, interaction with the USD department, VM handling

- **Telescope Instrument Operators** – operating the instruments and telescopes

The Control Room

How are the Obs observed in the SM?

- Three queues system A,B,C (highest -> lowest rank)
- An automated tool OT3 (Observing Tool 3) ranks observations based on the weather/other conditions (time critical) provided by the Night Astronomer or the Telescope Instrument Operator
- The highest ranked OB by OT3 is observed
- Night astronomer classifies according to conditions

OT3 (Observing tool)

First quality check

• The Night Astronomer at the mountain checks the quality of the data taken

- checking if the correct object is observed with the Finding chart

- checking if the conditions like seeing, sky transparency, sometimes SNR in frame are fulfilled

- classifies the obtained data based on the above constraints as A,B, C or D (fulfilled completely, some constraints violated but still acceptable, must repeat, not fulfilled but not repeat)

+ES+ 0 +

Calibrations and data cycle

• Next day, calibration data is taken

• The instrument performance is checked regularly by the Paranal and Garching staff

• The data are archived in the ESO Archive where it can be downloaded by the PIs

Daily calibrations check

ESO data reduction pipelines

Does it make sense to apply for the VLT time?

- Well, if the program requires 8-m telescope then YES!
- VLT is a leading facility and Czech Republic is an ESO member state, therefore we should be using the advantages of being ESO members
- Competition is tough. If the time is not awarded immediately, one has to resubmit or modify and resubmit again the proposal
- Before applying, the ESO Archive should be checked -> there is plenty of data already available!
